

Hovr Bracket System

The Hovr Bracket System allows for industry professionals to make floating shelves with confidence. It provides a standardized way to install floating storage that has maximum customer safety & usage capabilities. No more sagging, shelf failure, or slanting. Get peace of mind knowing your customers are in good hands & you will not be receiving a call back about the floating shelves sagging or failing over time.

How it works:

Male & Female Brackets

The Hovr system has both a male and female bracket that interlock with one another. After installing the female bracket into the shelf, place the male bracket on the wall. The two will then “click” in and become one.

Set Screws or Epoxy Glue

At the bottom of the interlocked brackets is the set screw. This ensures there is no movement between the brackets and allows for maximum strength. You also have the option of not using the set screw & substituting with Epoxy glue to bind the brackets together.

Hovr Benefits:

- It is safe: It prevents sag & failing shelving.
- It is simple: There is no special hardware required for installation & use.
- It is strong: The current standard cannot hold any significant weight - the Hovr Bracket System is strong as the average load capacity (10-inch depth) is 300lbs.
